**Response**

Response:
The `_arithmetic_mask` method handles mask propagation during arithmetic operations. The logic checks if either operand has

The issue arises when one operand has a mask and the other does not, leading to a `NoneType` being involved in the `bitwise_

Let's edit the `_arithmetic_mask` method to ensure that when one operand lacks a mask, the existing mask is copied over cor

Action:
```
edit 'return handle_mask(self.mask, operand.mask, **kwds)' '# Ensure mask propagation when one operand lacks a mask
        if self.mask is None:
            return deepcopy(operand.mask)
        elif operand.mask is None:
            return deepcopy(self.mask)
        else:
            return handle_mask(self.mask, operand.mask, **kwds)'
```
