Part1: When2Tool benchmark: Do agents know when they need tools?

15 envs &
3 multi-hop envs

	Category A: Can I compute this?	Category B: Do I know this?	Category C: Can I execute this reliably?
	Calculator, Statistics, Counting, Matrix, Prime, Multi-Cal	Retriever, History, GameRule, Hash, decoding, Multi-Ret	List, Date&Time, Code, Schedule, Regex, Multi-code
Easy (solvable w/o tools)	Small scale computation (e.g. 12+7)	Common Knowledge (e.g. Capital of France)	Short procedures (1-2 Operations)
Medium (Decision boundary)	Mid scale computation (5+ digit ans)	Uncommon Knowledge (e.g. SHA1 hash of “pooling layer”)	Moderate procedures (~5 Operations)
Hard (impossible w/o tools)	Large computation (15+ digit ans)	Not Real World Knowledge (e.g. Rules of Corsair's Gambit)	Untraceable Executions (e.g. hard DP or recursion)

Part2: Probe&Prefill: From hidden state to better tool-call decisions
